

PROJECT DEVELOPMENT PHASE

1. Development Environment

PocketSmart AI was developed using a simple web-based development environment. The application uses Python for the backend processing and HTML for the user interface.

2. Technologies Used

Programming Language: Python

Web Technology: HTML

Framework: Flask

Development Tool: Visual Studio Code

Web Browser: Google Chrome / Microsoft Edge

3. Module Development

The project is divided into the following modules:

User Input Module – Accepts the user's name, monthly budget, and total expenses.

Budget Calculation Module – Calculates the remaining balance.

Recommendation Module – Generates a simple recommendation based on the budget status.

Output Module – Displays the budget summary and recommendation.

4. Implementation

The application was implemented using Python and Flask. The HTML page provides the user interface, while the Python program processes the entered budget and expense details.

The basic calculation used is:

Remaining Balance = Monthly Budget – Total Expenses

5. Input Screen Development

The input screen allows the user to enter:

- User Name
- Monthly Budget
- Total Expenses

The entered information is submitted to the application for processing.

6. Budget Calculation

The system calculates the remaining balance using the monthly budget and total expenses.

Example:

Monthly Budget = ₹10,000

Total Expenses = ₹7,500

Remaining Balance = ₹10,000 – ₹7,500 = ₹2,500

7. Recommendation Generation

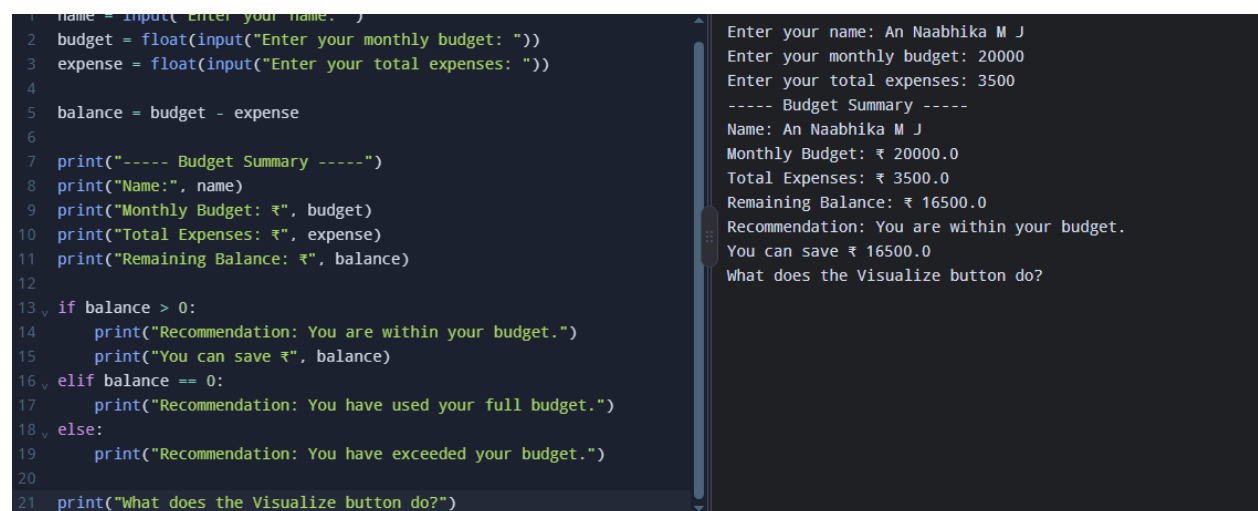

The system provides a basic recommendation based on the remaining balance.

- If the balance is positive, the user is within the budget.
- If the balance is zero, the complete budget has been used.
- If the balance is negative, the user has exceeded the budget.

8. Output Screen Development

The output screen displays the calculated budget summary and recommendation clearly so that the user can understand their spending status easily.

9. Implementation Screenshots

```
1 name = input("Enter your name: ")
2 budget = float(input("Enter your monthly budget: "))
3 expense = float(input("Enter your total expenses: "))
4
5 balance = budget - expense
6
7 print("----- Budget Summary -----")
8 print("Name:", name)
9 print("Monthly Budget: ₹", budget)
10 print("Total Expenses: ₹", expense)
11 print("Remaining Balance: ₹", balance)
12
13 if balance > 0:
14     print("Recommendation: You are within your budget.")
15     print("You can save ₹", balance)
16 elif balance == 0:
17     print("Recommendation: You have used your full budget.")
18 else:
19     print("Recommendation: You have exceeded your budget.")
20
21 print("What does the Visualize button do?")
```

Enter your name: An Naabhika M J
Enter your monthly budget: 20000
Enter your total expenses: 3500
----- Budget Summary -----
Name: An Naabhika M J
Monthly Budget: ₹ 20000.0
Total Expenses: ₹ 3500.0
Remaining Balance: ₹ 16500.0
Recommendation: You are within your budget.
You can save ₹ 16500.0
What does the Visualize button do?
